Case Study

The construction team on this project were looking for a decorative yet very durable seamless floor finishing solution, which had to be more durable than bonded sheet vinyls or linoleum tiles, but with the same resilience and comfort underfoot. Today, this concept in flooring is often referred to as a 'Comfort Floor', where the floor covering is used to help absorb noise, especially from footfall, as well being more comfortable underfoot than rigid materials, such as plastics and ceramics etc. As a result, the resin floor finish can contribute significantly to making a comfortable modern working environment.

For this floor area of more than 1300m², NCC were able to meet all the requirements with a Conifloor polyurethane resin based, comfort floor system. This system consists of an epoxy primer, a flexible, coloured, polyurethane base coat, and an exceptionally durable and attractive polyurethane top sealing coat, with a matt finish. Conifloor comfort floor systems are tough and resilient, they are also seamless with far fewer joints / areas of weakness, which makes them far more easily cleaned and a much more hygienic option.

Incidentally, NCC's logistical advantages with Conica systems also contributed to the success of this project - From order to delivery, the resin flooring materials were all manufactured and delivered within just 7 days, thereby positively assisting the contractors to control their tight construction programme and of course their budget!
